

Performance Surveyor

Enterprise reporting and analysis across any/all data sources

Performance Surveyor

Performance Surveyor rapidly delivers the benefits of an automated and standardized performance analysis and capacity management process seamlessly using data already available from any/all of your existing infrastructure and application management solutions.

Performance Surveyor automates the entire analysis, planning and reporting process to deliver meaningful results more quickly, with lower costs, across all of your infrastructure and applications. All with no agents to deploy and manage, and no databases to implement, populate and maintain.

Features

- Automated, comprehensive, customizable report generation (daily, weekly, monthly, etc.)
- Powerful diagnostic and proactive analysis via multi-metric, multi-axis graphing, correlation, trending, exception, heat-map, predictive, and other advanced analytic approaches
- Automates process and deliverables of performance and capacity management
- Advanced, modular easy to use and flexible analytics
- Ease of use and customize via modular, flexible, web-based GUI, no coding or scripting
- Seamless data federation, integration and abstraction
- Automated predictive problem detectors: CPU, Memory Leaks, file system overload, etc.
- Low operating costs and minimal footprint via agent-less, federated data architecture (no agents or databases to maintain)

The Performance Surveyor Solution

Performance Surveyor is a web-based, agent-less and data-agnostic solution that extends the benefits of performance analysis and capacity management disciplines across all existing and relevant technical and business data sources; using existing staff resources and expertise, complying with existing processes, and scaling to the largest of environments.

Performance Surveyor quickly and automatically turns your existing data into actionable intelligence for performance and capacity related decision support.

Layering seamlessly on top of any/all metric sources - from commoditized server to complex, service-related - Performance Surveyor protects your investment in infrastructure and application management solutions and processes by automating your entire process of analysis and reporting against all sources - today and into the future.

First Day ROI and Value

Performance Surveyor installs in minutes, and has no agents or databases to install or maintain. With 100% integration to many leading performance and capacity solutions, built-in expertise, automated analysis and best practice reports insights and value are available within minutes.

Analysis and Planning at a Business Application Level

Technical and business performance data-source and metric extension are easy with Performance Surveyor. Using a drag-and-drop GUI, Performance Surveyor rapidly integrates metrics of interest

Who uses it?

IT Executives
IT Managers
Business Managers
IT Clients

For what?

Immediate ROI and Value by automating, accelerating and amplifying performance analysis and capacity management processes and deliverables - using existing IT management tools and data

Elevates performance analysis and capacity management reporting value by spanning ALL relevant technical and business metrics and key performance indicators (KPIs)

Reduces time to create performance reports and recommendations by 95% or more

Increases scope and reach of existing staff resources by 400% or more - extending the benefits of ITIL® Capacity Management across your entire IT infrastructure.

and importance with no costly code or scripts to write and maintain, while isolating users from needing to understand the structure of the underlying data sources.

By linking business KPIs (transaction rates or response times, etc.) to the underlying physical, virtual and cloud resources supporting those services, a higher-level, higher value understanding of performance and capacity requirements is achieved.

Performance Surveyor provides federated data access to existing performance, application, service, business or configuration data sources and automates high-value multi-metric correlation analysis, projection, prediction and reporting.

Finally, all analysis and reports are available across all metric sources - from higher-level, color-coded linkable “business dashboards” to the most technically detailed performance analysis.

Scalable Value

Performance Surveyor’s flexibility enables your existing staff to automate their analytic approaches: scarce senior-level staff expertise can now be embedded for all to leverage. For maximum organizational productivity, all analysis and

reports - ad-hoc and automated - are shareable across end-user constituencies.

Automatically generated projection-based and exception-oriented analysis and reports ensures the scalability of staff, processes and deliverables to application environments larger than 40,000 server images

Alignment with Best Practices: Business Aware Capacity Intelligence

Unlike other solutions that require modification of your processes and deliverables to accommodate their rigid, one-size-fits-all products, Performance Surveyor uniquely adapts to your processes and existing data sources; completely scheduling, automating, and standardizing the complete process - enabling adherence to ITIL Capacity Management principles.

Deliverables are easily customized and standardized to meet the unique and differing requirements of every end-user. Business alignment is achieved by spanning all existing sources of performance and capacity related metrics - servers, mainframes, storage, networks, applications, services, power/thermal as well as business service and financial metrics.
